

Failure Analysis Services

Determine the failure mechanism and its basic cause

Failure analysis is the process of collecting and analyzing data to determine the cause of a failure and how to prevent it from recurring. Reksolindo's offers a detailed analysis on suspected failing devices to define failure mode and failure mechanism.

We have familiarity with processes and materials of construction for major components such as piping, pressure vessels, columns, valves and heat exchangers and the problems these encounter in service.

Our standards are high in appreciating the client's needs for understanding the exact cause for a failure and we are known for providing honest, practical solutions with the specific needs of the client in mind.

Combination of our engineering experience and fully equipped laboratory facilities allows us to efficiently uncover the root cause of a failure and help recommend the best solution to prevent recurrence. We look forward to helping you with your failure needs and providing you with practical engineering solutions.
